GATES

AUTOMATION ACCESSORY INFO

MAG LOCK

A magnetic lock that is used to hold a gate locked in the closed position. Excellent for use in high wind zones.

LOOP DETECTOR

Above and below ground loop detectors that identify when a vehicle drives over them and triggers the gate to open.

FLASHING LIGHT

A light mounted on or near the gate to warn others that it is operating and to remain clear of the area.

SAFETY BEAMS

Safety devices used to detect if a vehicle, person or object is in the field of the gate.

BARRIER CURTAIN SENSOR

Much the same as a Safety Beam but covering a larger area. Often used in situations where extra safety is required.

PASSIVE EDGE

An additional safety feature that attaches to the frame of the gate and post. Any pressure against the sensors would cause the gate to re-open.

WIFI APP CONTROL

A cost effective option for app control with no ongoing monthly costs. This works in with many other devices eg: Siri, Google Home, Apple Watch and Alexa. Set automatic opening zones so that the gate opens as you approach or set specific times for the gate to be open or closed. Talk to us about the many other applications.

3G APP CONTROL

An app that allows you to control and view the status of your gate at ease from anywhere. Opening options are endless; you can use the app, text or call the gate. Easily add and remove usage rights for other users including set time periods, certain amounts of use, or a one off code to text for a one time event. Talk to us about the many other applications.
